## Files Changed

- `billing/retry_policy.py`

- `billing/webhook_handler.py`
- `billing/tests/test_retry_policy.py`
- `billing/config/retry_defaults.yaml`

## Known Downstream Dependencies (for Dependency Graph Lookup tool to reference)

- checkout-service
  - invoicing-service
  - refunds-service
  - notification-service
  - fraud-detection-service
  - reporting-service
- 

## A second, contrasting test input — low-risk category

For testing the auto-approve / high-trust path, use this instead:

- **Submission ID:** SUB-91501
- **Author:** R. Iyer
- **Service:** marketing-site
- **Files changed:** `homepage/copy/hero_banner.txt`
- **Diff:** Changed hero banner text from "Ship faster with confidence" to "Ship faster, with total confidence."
- **Downstream dependencies:** none (static content, no service dependencies)
- **Automated tests:** 12/12 passed

This should classify as "text/copy change," match against the 63-entry trusted history in the mock Ledger dataset, and auto-approve without escalation, giving you a clean contrast case against the payments logic escalation path.
