

Judgment Ledger - Mock historical data

Format: one row per past decision. **human_corrected = yes** means a human overrode or caught something the automated path would have missed.

Category summary (what the Threshold Agent should derive from this data):

- **payments logic** — 6 entries, 2 human corrections, well below trust threshold. Should remain escalation-required.
- **config change** — 41+ entries, 0 corrections. Comfortably trusted, auto-approve appropriate.
- **text/copy change** — 63+ entries, 0 corrections. Highest-trust category in the system.
- **auth/permissions** — 9 entries, 1 human correction (a real caught issue). Should remain escalation-required, arguably tightened further given the severity of what was caught.
- **data schema migration** — only 3 entries. Too thin to trust regardless of outcome quality, this category should stay escalation-required purely on sample size.
